Contents

⫸ Orbi RBK40 Mesh System Setup Guide

Disconnect power to both the modem and Orbi. Unplug everything. Wait a minute or two. Plug
in the modem first. Wait until every light it normally has when connected is solid or blinking the
way it should. Could take 2–3 minutes.
Connect the LAN cable between the modem and Orbi router, then turn on the devices.

⫸ RBK40 Orbilogin.net Setup

Connect the Ethernet cable from the Orbi into your PC or

you can use the default WiFi SSID of

the Orbi network.

1. After the computer connection, open your browser. Type orbilogin.net in the address
bar. If you get a "site can't be reached" error, you either typed it wrong or your
computer is still trying to use your old network. Restart the browser or just reboot the
computer.

2. You should get the Orbi RBK40 mesh setup page. It'll ask for a username and password.
Default is usually admin for user and password for, well, password — unless you've set
something custom before.

3. Follow the prompts. It'll detect your internet, maybe reboot the router once. Just let it
do its thing.

4. Once it says setup is done, you can connect to the new Wi-Fi it creates. The name and
password are on the sticker under the router. Change them later in settings if you want
something memorable.
Then just end the Orbi setup by the updating the firmware and connecting the satellite.

▶ Sync Orbi RBS40 Satellites with Router

▶ On the router, press the Sync button.

▶ Within 2 minutes, press the Sync button on the satellite. The satellite's ring light will start doing its lights routine:

▶ Blinking white = syncing in progress

▶ Solid blue = good connection

▶ Solid amber = weak connection

▶ Magenta = no connection

Orbi Satellite Colors – Meaning and Fixing Related Issues

🔴 Red ⚪ White 🟣 Magenta
🟠 Amber 🟢 Green 🔵 Blue

The sync process can take a couple of minutes. If it works, the ring will go off after a while. Once it's synced, unplug it and move it to its permanent spot.
