# Orbi Login

# Orbi 6E RBKE963 Manual

## Manual

# TABLE OF CONTENT
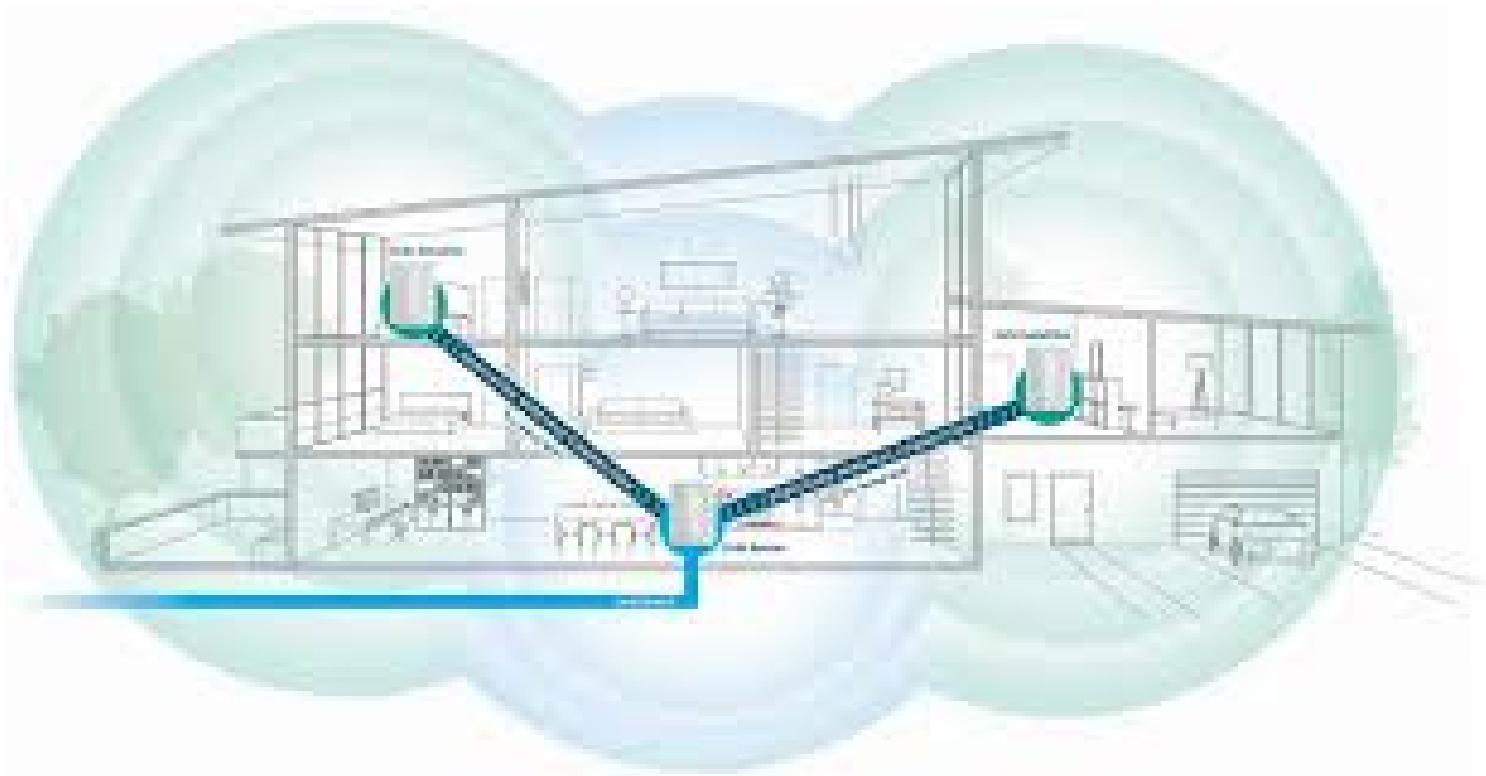

# Unboxing the device

- The main router and the satellites look a lot alike. Look at the labels. Usually, the router says RBR and the satellites say RBS.

# Placement is the Key

Put the gadgets in different places; don't put them immediately next to each other. The router is close to the modem, and the satellites are in places where WiFi frequently drops.

# Power cycle the modem

Turn it off and on again before connecting to your Orbi router.

# Internet information

: Keep your ISP's PPPoE login or static IP information safe. Most people utilize DHCP without even thinking about it.
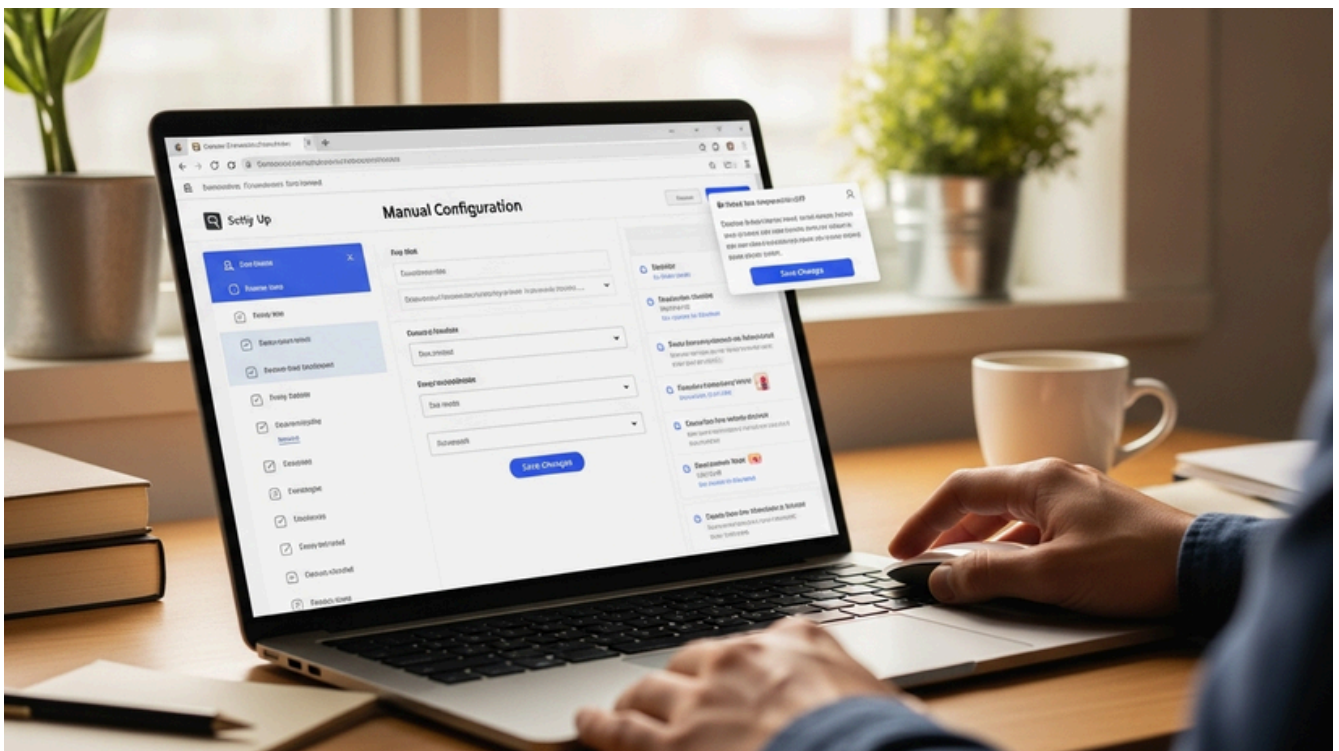

# Set up the Orbi 6E RBKE963 with the app

- Most people perform the setup with the Orbi app. In simple terms, here's how it goes:
- ·Install the app. The app is compatible with both iOS and Android.
- ·Make a Netgear account or sign in. If you don't have an account create one.
- ·Connect the modem to the router using the ethernet connection that came with it. Turn it on.

- ·Now, add satellites. Plug them into the wall. The software will automatically look for and connect them.
- ·Give your WiFi network a name. Choose a name and password that you can remember.
- ·Update the firmware. The software normally makes you do this. Don't unplug it while it's running.
- This is easy when it works. But if something doesn't work, like the app not identifying satellites, you'll have to try doing it by hand.

- Setting Up via Browser (Manual Method)
- The app may not work with your device. Some people wish to utilize a laptop with a web browser. It's easy to do that:
- ·Connect your computer to the Orbi WiFi. The default username and password are on a sticker on the bottom.
- ·Open your browser and type orbilogin.com or 192.168.1.1 into the address box.
- ·A window for logging in opens. Enter your username and password, which are usually "admin" and "password" (unless you modified them).
- ·The wizard for setting things up begins. Follow the instructions to connect to your ISP and set up your satellites.

# Connect the satellites

A LOT OF PEOPLE FIND THIS TO BE A PROBLEM. THE ORBI SYSTEM ONLY WORKS IF THE SATELLITES SYNC UP RIGHT. YOU WILL HAVE DEAD ZONES IF THEY DON'T. HELPFUL TIPS:

·DURING THE FIRST SYNC, MAKE SURE THE SATELLITE IS NO MORE THAN 6 TO 8 FEET AWAY FROM THE MAIN ROUTER. YOU CAN MOVE IT LATER.

·WAIT FOR THE RING OF LEDS. AMBER DENOTES WEAK, SOLID BLUE MEANS GOOD AND MAGENTA MEANS UNSUCCESSFUL.

·IF THE COLOR IS MAGENTA, PRESS AND HOLD THE SYNC BUTTON ON BOTH THE ROUTER AND THE SATELLITE FOR TWO MINUTES.
